

GET RID OF MILDEW, MOLD, ODOR

Mold is a fuzzy growth on moist organic matter by several types of fungi. Mildew is mold growing on fabric.

The quantity of mold fragments and spores needed to cause health problems varies from person to person. Toxic molds can produce several toxic chemicals called mycotoxins that can damage your health. These chemicals are present on the spores and small mold fragments that are released into the air.

When mold grows indoors in moist organic materials, building occupants may begin to notice odors and suffer a variety of health problems associated with mold exposure.

Inhaling or touching mold or mold spores can cause allergic reactions in sensitive individuals. Allergic reactions to mold are common — these reactions can be immediate or delayed up to six hours. Allergic reactions include:

- Respiratory problems (cough, sneezing, wheezing, infection, difficulty breathing)
- Hay fever-type symptoms
- Nose and throat irritation
- Nasal or sinus congestion
- Watery, reddened, or burning eyes
- Sensitivity to light
- Red eyes
- Runny nose
- Sneezing
- Dermatitis (skin rash or irritation)
- Headache
- Fatigue
- Asthma

In high concentrations, mold fragments, spores, and mycotoxins can trigger symptoms even in individuals who have no allergies.

Beyond Green Beyond Clean has introduced products employing natural enzyme technologies to destroy mold spores, bacteria and odors naturally, with no harmful residue.
